--> Comment Text :
The geologic siting for the nuclear waste repository at this location is inherently flawed when juxtaposed conterminously with the method of storing the casks that you propose.

Using the proposed types of casks and your method of storing the casks at this particular siting at Yucca Mountain will in fact be creating a breeder reactor of such mammoth portions that the earth will not be able to contain it, once the cataclysmic events commence, and this site initiates the reactions.

As grim as this is to talk about for me, do you recall why the structure of the Trade Towers collapsed all the way to the ground? It was because that when the upper middle floors were weakened by the crash of the plane and subsequent fire the floors above came down and initiated spontaneous collapse of all the floors below, and the result was what is being cleaned up as we speak.

Now with that put the casks that you plan to store at the bottom of those buildings collapse-ground zero.

Now similar to this, multiply the force by millions representing the pressure of a geologic strata coming down on top of your casks resting on an immovable object and they all will be obliterated in the process. Crushed like egg shells.

Of course this is all simplified, but you get the picture.

Now the radioactive material in its glass like encapsulation will, not maybe but will migrate together and become a radioactive ore body creating temperatures from the latent heat still contained to start the breeding reactions.

With this supercriticality can commence. A molten magma type environment that is not at the core of the earth, but is at near surface and totally out of control! What are you going to do then? When concrete melts like wax. Send in clean up crews?

Welcome to ground zero II.

Your own data that has been gathered can be used as data to support this possibility. And something that is possible, is most likely probable and with that you must look into the model that supports this ground zero II scenario.

Take the high road. The issues supporting this catastrophic probability is in depth and getting into detail here is not pragmatic. However I pray that you do consider what is being brought forth to you today, this 14th day of October, 2001 and review a model so grim that in the future it will most likely be referred to as 'Abrahams Folly'.

I know that the DoE's standard procedure is to disclaim anything contrary to their intent straight away without reviewing the data, but with this, for the sake of our civilization as we now enjoy it to be in the western United States you must review these details.

I look forward to explaining this model with your organization further and hope that you are interested enough to do so.

I will prepare on sending you the information that is referred to herewith for the record.

In closing remember this, pressure+radioactivity both in copious amounts = heat

552065

sufficent enough to creat ground zero II, and all the ingrediants will be
availble at Yucca Mountain to create just that.

Thank you,

WmS
